

# ANOVA

# ANALYSIS OF VARIANCE

- In the previous section we used Z- and t-Distributions to answer the question *"What is the probability that two samples come from the same population?"*

# ANALYSIS OF VARIANCE

- In this section we introduce a new distribution – the F-Distribution
- Used to answer the question

*"What is the probability that two samples come from populations that have the same variance?"*

# ANALYSIS OF VARIANCE

- Can also answer the question

*"What is the probability that three or more samples come from the same population?"*

# **ANOVA**

## **ANALYSIS OF VARIANCE**

# ANOVA

- In the previous section we tested two samples to see if they likely came from the same parent population.
- What if we had three (or more) samples?
- Could we do the same thing?

# ANOVA

- Our null hypothesis would look like:

$$H_0: \mu_A = \mu_B = \mu_C$$

# ANOVA

- We *could* test each pair:

$$H_0: \mu_A = \mu_B \quad \alpha = 0.05$$

$$H_0: \mu_A = \mu_C \quad \alpha = 0.05$$

$$H_0: \mu_B = \mu_C \quad \alpha = 0.05$$

# ANOVA

- The problem is, our overall confidence drops:

$$H_0: \mu_A = \mu_B \quad \alpha = 0.05 \quad .95 \times .95 \times .95 = .857$$

$$H_0: \mu_A = \mu_C \quad \alpha = 0.05 \quad 85.7\% \text{ confidence level}$$

$$H_0: \mu_B = \mu_C \quad \alpha = 0.05$$

# ANOVA

- This is where ANOVA comes in!
- We compute an **F value**, and compare it to a critical value determined by our **degrees of freedom** (the number of groups, and the number of items in each group)

# ANOVA

Let's work with some data:

GroupA	GroupB	GroupC
37	62	50
60	27	63
52	69	58
43	64	54
40	43	49
52	54	52
55	44	53
39	31	43
39	49	65
23	57	43

# ANOVA

First calculate the sample means

Next calculate the overall mean

	GroupA	GroupB	GroupC
	37	62	50
	60	27	63
	52	69	58
	43	64	54
	40	43	49
	52	54	52
	55	44	53
	39	31	43
	39	49	65
	23	57	43
$\mu_{A,B,C}$	44	50	53
$\mu_{TOT}$	49		

# ANOVA

ANOVA considers two types of **variance**:

## Between Groups

how far group means stray  
from the total mean

## Within Groups

how far individual values stray from  
their respective group mean

# ANOVA

The F value we're trying to calculate is simply the ratio between these two variances!

$$F = \frac{\textit{Variance Between Groups}}{\textit{Variance Within Groups}}$$

# ANOVA

Recall the equation for variance:

$$s^2 = \frac{\Sigma(x - \bar{x})^2}{n - 1} = \frac{SS}{df}$$

Here  $\Sigma(x - \bar{x})^2$  is the “sum of squares” *SS*  
and  $n - 1$  is the “degrees of freedom” *df*

# ANOVA

So the formula for the F value becomes:

$$F = \frac{\text{Variance Between Groups}}{\text{Variance Within Groups}} = \frac{\frac{SSG}{df_{groups}}}{\frac{SSE}{df_{error}}}$$

$SS(B) = \sum n (\bar{x} - \bar{X}_{GM})^2$

$SSW = \sum_{j=1}^g \sum_{i=1}^{n_j} (y_{ij} - \bar{y}_j)^2$

$SSG$  = Sum of Squares Groups

$SSE$  = Sum of Squares Error

$df_{groups}$  = degrees of freedom(groups)

$df_{error}$  = degrees of freedom (error)

# ANOVA

$$SSG = 420$$

Sum of Squares Groups

$$(\mu_A - \mu_{TOT})^2 = (44 - 49)^2 = 25$$

$$(\mu_B - \mu_{TOT})^2 = (50 - 49)^2 = 1$$

$$(\mu_C - \mu_{TOT})^2 = (53 - 49)^2 = 16$$

$$SS = 42$$

Multiply by the number of items in each group:

$$42 \times 10 = 420$$

	GroupA	GroupB	GroupC
	37	62	50
	60	27	63
	52	69	58
	43	64	54
	40	43	49
	52	54	52
	55	44	53
	39	31	43
	39	49	65
	23	57	43
$\mu_{A,B,C}$	44	50	53
$\mu_{TOT}$	49		

# ANOVA

$$SSG = 420$$
$$df_{groups} = 2$$

## Degrees of Freedom Groups

$$df_{groups} = n_{groups} - 1$$
$$= 3 - 1$$
$$= 2$$

GroupA	GroupB	GroupC
37	62	50
60	27	63
52	69	58
43	64	54
40	43	49
52	54	52
55	44	53
39	31	43
39	49	65
23	57	43

$\mu_{A,B,C}$	44	50	53
$\mu_{TOT}$	49		

# ANOVA

## Sum of Squares Error

$(x_A - \mu_A)^2$	$(x_A - \mu_A)^2$	$(x_B - \mu_B)^2$	$(x_B - \mu_B)^2$	$(x_C - \mu_C)^2$	$(x_C - \mu_C)^2$
49	64	144	16	9	1
256	121	529	36	100	0
64	25	361	361	25	100
1	25	196	1	1	144
16	441	49	49	16	100
1062			1742		496
		TOTAL		3300	

$$SSG = 420$$

$$df_{groups} = 2$$

$$SSE = 3300$$

$$(37 - 44)^2$$

$$= (-7)^2$$

$$= 49$$

GroupA	GroupB	GroupC
37	62	50
60	27	63
52	69	58
43	64	54
40	43	49
52	54	52
55	44	53
39	31	43
39	49	65
23	57	43
$\mu_{A,B,C}$	44	50
$\mu_{TOT}$	49	

# ANOVA

$$SSG = 420$$

$$df_{groups} = 2$$

$$SSE = 3300$$

$$df_{error} = 27$$

## Degrees of Freedom Error

$$df_{error} = (n_{rows} - 1) * n_{groups}$$

$$= (10 - 1) * 3$$

$$= 27$$

	GroupA	GroupB	GroupC
	37	62	50
	60	27	63
	52	69	58
	43	64	54
	40	43	49
	52	54	52
	55	44	53
	39	31	43
	39	49	65
	23	57	43
$\mu_{A,B,C}$	44	50	53
$\mu_{TOT}$	49		

# ANOVA

$$\begin{aligned}
 SSG &= 420 \\
 df_{groups} &= 2 \\
 SSE &= 3300 \\
 df_{error} &= 27
 \end{aligned}$$

Plug these into our formula:

$$F = \frac{\frac{SS}{df_{group}}}{\frac{SS}{df_{error}}} = \frac{\frac{420}{2}}{\frac{3300}{27}} = \frac{210}{122.22} = \mathbf{1.718}$$

	GroupA	GroupB	GroupC
	37	62	50
	60	27	63
	52	69	58
	43	64	54
	40	43	49
	52	54	52
	55	44	53
	39	31	43
	39	49	65
	23	57	43
$\mu_{A,B,C}$	44	50	53
$\mu_{TOT}$	49		

# ANOVA WITH EXCEL DATA ANALYSIS

The screenshot shows the 'Data Analysis' dialog box in Microsoft Excel. The 'Analysis Tools' list on the left has 'Anova: Single Factor' selected. The dialog box includes 'OK', 'Cancel', and 'Help' buttons on the right. In the background, an Excel spreadsheet is visible, showing the results of an ANOVA test. The 'F' value for 'Between Groups' is highlighted in yellow, matching the value in the text above the image.

# F DISTRIBUTION

# F-DISTRIBUTION

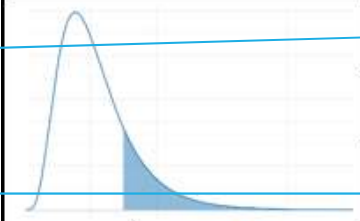

# F-DISTRIBUTION

Look up our critical value from an F-table

- use a table set for 95% confidence
- find numerator df
- find denominator df
- Critical value = 3.35

F-Table Upper Tail Area of 0.05

denominator df	Numerator df				
	1	2	3	4	5
25	4.24	3.39	2.99	2.76	2.60
26	4.23	3.37	2.98	2.74	2.59
27	4.21	3.35	2.96	2.73	2.57
28	4.20	3.34	2.95	2.71	2.56
29	4.18	3.33	2.93	2.70	2.55
30	4.17	3.32	2.92	2.69	2.53

## F-SCORES IN MS EXCEL

- In Microsoft Excel, the following function returns an F-score:

$\alpha$	df1	df2	Formula	Output Value
0.05	2	27	=FINV(A2,B2,C2)	3.3541308285292

# F-SCORES IN PYTHON

```
>>> from scipy import stats
```

```
>>> stats.f.ppf(1-.05,dfn=2,dfd=27)
```

```
3.3541308285291986
```

# ANOVA

Recall our null hypothesis:

$$H_0: \mu_A = \mu_B = \mu_C$$

Since  $F$  is less than  $F_{\text{critical}}$

$$1.718 < 3.354$$

we fail to reject the null hypothesis!

# ANOVA EXERCISE#1

- In an effort to receive faster payment of invoices, a company introduces two discount plans
- One set of customers is given a 2% discount if they pay their invoice early
- Another set is offered a 1% discount
- A third set is not offered any incentive

# ANOVA EXERCISE

- The results are as follows:
- Using ANOVA, can we say that the offers result in faster payments?

2% disc	1% disc	no disc
11	21	14
16	15	11
9	23	18
14	10	16
10	16	21

# ANOVA EXERCISE

1. Calculate the means

	2% disc	1% disc	no disc
	11	21	14
	16	15	11
	9	23	18
	14	10	16
	10	16	21
$\mu_{2,1,0}$	12	17	16
$\mu_{TOT}$	15		

# ANOVA EXERCISE#1

$$SSG = 70$$

## 2. Find Sum of Squares Groups

$$(\mu_2 - \mu_{TOT})^2 = (12 - 15)^2 = 9$$

$$(\mu_1 - \mu_{TOT})^2 = (17 - 15)^2 = 4$$

$$(\mu_0 - \mu_{TOT})^2 = (16 - 15)^2 = 1$$

---

14

Multiply by the number of items in each group:

$$14 \times 5 = 70$$

	2% disc	1% disc	no disc
	11	21	14
	16	15	11
	9	23	18
	14	10	16
	10	16	21
$\mu_{2,1,0}$	12	17	16
$\mu_{TOT}$	15		

# ANOVA EXERCISE

$$SSG = 70$$
$$df_{groups} = 2$$

## 3. Degrees of Freedom Groups

$$df_{groups} = n_{groups} - 1$$
$$= 3 - 1$$
$$= 2$$

	2% disc	1% disc	no disc
	11	21	14
	16	15	11
	9	23	18
	14	10	16
	10	16	21
$\mu_{2,1,0}$	12	17	16
$\mu_{TOT}$	15		

# ANOVA EXERCISE

## 4. Sum of Squares Error

$(x_2 - \mu_2)^2$	$(x_1 - \mu_1)^2$	$(x_0 - \mu_0)^2$
1	16	4
16	4	25
9	36	4
4	49	0
4	1	25
<b>34</b>	<b>106</b>	<b>58</b>
<b>TOTAL</b>		<b>198</b>

$$SSG = 70$$

$$df_{groups} = 2$$

$$SSE = 198$$

	2% disc	1% disc	no disc
	11	21	14
	16	15	11
	9	23	18
	14	10	16
	10	16	21
$\mu_{2,1,0}$	12	17	16
$\mu_{TOT}$	15		

## ANOVA EXERCISE

### 5. Degrees of Freedom Error

$$\begin{aligned}
 df_{error} &= (n_{rows} - 1) * n_{groups} \\
 &= (5 - 1) * 3 \\
 &= 12
 \end{aligned}$$

$$SSG = 70$$

$$df_{groups} = 2$$

$$SSE = 198$$

$$df_{error} = 12$$

	2% disc	1% disc	no disc
	11	21	14
	16	15	11
	9	23	18
	14	10	16
	10	16	21
$\mu_{2,1,0}$	12	17	16
$\mu_{TOT}$	15		

## ANOVA EXERCISE

6. Calculate F value:

$$F = \frac{\frac{SS}{df_{groups}}}{\frac{SS}{df_{error}}} = \frac{\frac{70}{2}}{\frac{198}{12}} = \frac{35}{16.5} = \mathbf{2.121}$$

7. Look up  $F_{critical}$  : **3.885**

$$SSG = 70$$

$$df_{groups} = 2$$

$$SSE = 198$$

$$df_{error} = 12$$

	2% disc	1% disc	no disc
	11	21	14
	16	15	11
	9	23	18
	14	10	16
	10	16	21
$\mu_{2,1,0}$	12	17	16
$\mu_{TOT}$	15		

## ANOVA EXERCISE

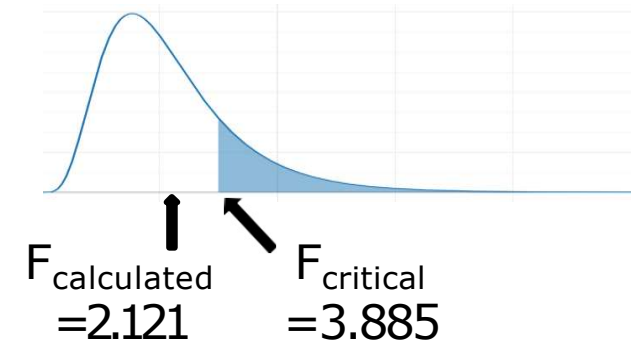

$$\begin{aligned}SSG &= 70 \\df_{groups} &= 2 \\SSE &= 198 \\df_{error} &= 12\end{aligned}$$

Since  $F$  falls to the left of  $F_{\text{critical}}$

$$2.121 < 3.885$$

we fail to reject the  
null hypothesis!

## ANOVA EXERCISE

We don't have enough to support the idea that our offers changed the average number of days that customers took to pay their invoices!

# TWO-WAY ANOVA

## ONE-WAY VS TWO-WAY ANOVA

- In the previous examples we used one-way ANOVA to test one independent variable.
- For the invoice problem, the independent variable was the **incentive** offered.
- The dependent variable was the **time** it took to receive payment.

## ONE-WAY VS TWO-WAY ANOVA

- Two-Way ANOVA lets us test two independent variables at the same time
- For the invoice example, we might also consider the amount due
- We would have 3 invoices for \$50, 3 for \$100, etc. and offer different incentives at each dollar amount.

## ONE-WAY VS TWO-WAY ANOVA

- The resulting data might look like this:
- Here, each row or dollar amount is called a **block**.
- Essentially, we want to isolate and remove any variance contributed by the blocks, to better understand the variance in the groups.

	2% disc	1% disc	no disc
\$50	16	23	21
\$100	14	21	16
\$150	11	16	18
\$200	10	15	14
\$250	9	10	11

# ONE-WAY VS TWO-WAY ANOVA

- So how do we do that?

	2% disc	1% disc	no disc
\$50	16	23	21
\$100	14	21	16
\$150	11	16	18
\$200	10	15	14
\$250	9	10	11

## TWO-WAY ANOVA

- The goal of ANOVA is to separate different aspects of the total variance.
- In the previous examples we had only

Sum of Squares Groups (SSG) and » between groups  
Sum of Squares Error (SSE) » within groups

# TWO-WAY ANOVA

- These two variances **SSG** and **SSE** add up to our total variance

Sum of Squares Total (SST)

Sum of Squares Groups (SSG) and » between groups  
 Sum of Squares Error (SSE) » within groups

## TWO-WAY ANOVA

- Now we'll look at variance between rows, or blocks

	Group 1	Group 2	
Block A	8	11	
Block B	10	12	
Block C	12	13	
$\mu_{1,2}$	10	12	11

Sum of Squares Groups (SSG) and » between groups  
Sum of Squares Error (SSE) » within groups

## TWO-WAY ANOVA

- First calculate the block means
- Then calculate the

	Group 1	Group 2	$\mu_{A,B,C}$
Block A	8	11	9.5
Block B	10	12	11
Block C	12	13	12.5
$\mu_{1,2}$	10	12	11

Sum of Squares Blocks (SSB)

Sum of Squares Groups (SSG)

Sum of Squares Error (SSE)

» between blocks

» between groups

» within groups

## TWO-WAY ANOVA

- ANOVA still considers the relationship between the SSG and the SSE

Sum of Squares Blocks (SSB)

Sum of Squares Groups (SSG)

Sum of Squares Error (SSE)

$$F = \frac{\text{Var. Between Groups}}{\text{Var. Within Groups}} = \frac{\frac{SSG}{df_{groups}}}{\frac{SSE}{df_{error}}}$$

	Group 1	Group 2	$\mu_{A,B,C}$
Block A	8	11	9.5
Block B	10	12	11
Block C	12	13	12.5
$\mu_{1,2}$	10	12	11

- » between blocks
- » between groups
- » within groups

## TWO-WAY ANOVA

- By calculating the SSB, we remove some of the variance in SSE

Sum of Squares Blocks (SSB)

Sum of Squares Groups (SSG)

Sum of Squares Error (SSE)

$$F = \frac{\text{Var. Between Groups}}{\text{Var. Within Groups}} = \frac{\frac{SSG}{df_{groups}}}{\frac{SSE}{df_{error}}}$$

	Group 1	Group 2	$\mu_{A,B,C}$
Block A	8	11	9.5
Block B	10	12	11
Block C	12	13	12.5
$\mu_{1,2}$	10	12	11

- » between blocks
- » between groups
- » within groups

# TWO-WAY ANOVA

## Sum of Squares Groups (SSG)

$$(\mu_1 - \mu_{TOT})^2 = (10 - 11)^2 = 1$$

$$(\mu_2 - \mu_{TOT})^2 = (12 - 11)^2 = 1$$

---

2

multiply by the number of items in each group:  $2 \times 3 = 6$

$$F = \frac{\text{Var. Between Groups}}{\text{Var. Within Groups}} = \frac{\frac{SSG}{df_{groups}}}{\frac{SSE}{df_{error}}}$$

	Group 1	Group 2	$\mu_{A,B,C}$
Block A	8	11	9.5
Block B	10	12	11
Block C	12	13	12.5
$\mu_{1,2}$	10	12	11

$SSG = 6$

# TWO-WAY ANOVA

## Sum of Squares Blocks (SSB)

$$(\mu_A - \mu_{TOT})^2 = (9.5 - 11)^2 = 2.25$$

$$(\mu_B - \mu_{TOT})^2 = (11 - 11)^2 = 0$$

$$(\mu_C - \mu_{TOT})^2 = (12.5 - 11)^2 = 2.25$$

---

4.5

multiply by the number of items in each block:  $4.5 \times 2 = 9$

$$F = \frac{\text{Var. Between Groups}}{\text{Var. Within Groups}} = \frac{\frac{SSG}{df_{groups}}}{\frac{SSE}{df_{error}}}$$

	Group 1	Group 2	$\mu_{A,B,C}$
Block A	8	11	9.5
Block B	10	12	11
Block C	12	13	12.5
$\mu_{1,2}$	10	12	11

$SSG = 6$   
 $SSB = 9$

# TWO-WAY ANOVA

## Sum of Squares Total (SST)

$$\begin{aligned} & (8 - 11)^2 + (11 - 11)^2 + \\ & (10 - 11)^2 + (12 - 11)^2 + \\ & (12 - 11)^2 + (13 - 11)^2 = 16 \end{aligned}$$

no need to multiply since  
every item is represented

$$F = \frac{\text{Var. Between Groups}}{\text{Var. Within Groups}} = \frac{\frac{SSG}{df_{groups}}}{\frac{SSE}{df_{error}}}$$

	Group 1	Group 2	$\mu_{A,B,C}$
Block A	8	11	9.5
Block B	10	12	11
Block C	12	13	12.5
$\mu_{1,2}$	10	12	11

$$\begin{aligned} SSG &= 6 \\ SSB &= 9 \\ SST &= 16 \end{aligned}$$

## TWO-WAY ANOVA

### Sum of Squares Error (SSE)

$$\begin{aligned}SSE &= SST - SSG - SSB \\ &= 16 - 6 - 9 = 1\end{aligned}$$

no need to multiply since we're working with totals already

$$F = \frac{\text{Var. Between Groups}}{\text{Var. Within Groups}} = \frac{\frac{SSG}{df_{\text{groups}}}}{\frac{SSE}{df_{\text{error}}}}$$

	Group 1	Group 2	$\mu_{A,B,C}$
Block A	8	11	9.5
Block B	10	12	11
Block C	12	13	12.5
$\mu_{1,2}$	10	12	11

$$\begin{aligned}SSG &= 6 \\ SSB &= 9 \\ SST &= 16 \\ SSE &= 1\end{aligned}$$

## TWO-WAY ANOVA

So how do we calculate F?

Degrees of Freedom Groups  
is unchanged:

$$\begin{aligned}df_{groups} &= n_{groups} - 1 \\&= 2 - 1 \\&= 1\end{aligned}$$

$$F = \frac{\text{Var. Between Groups}}{\text{Var. Within Groups}} = \frac{\frac{SSG}{df_{groups}}}{\frac{SSE}{df_{error}}}$$

	Group 1	Group 2	$\mu_{A,B,C}$
Block A	8	11	9.5
Block B	10	12	11
Block C	12	13	12.5
$\mu_{1,2}$	10	12	11

$$SSG = 6$$

$$SSB = 9$$

$$SST = 16$$

$$SSE = 1$$

$$df_{groups} = 1$$

# TWO-WAY ANOVA

So how do we calculate F?

Degrees of Freedom Error has changed:

$$\begin{aligned} df_{error} &= (n_{blocks} - 1)(n_{groups} - 1) \\ &= (3 - 1)(2 - 1) \\ &= 2 \end{aligned}$$

$$F = \frac{\text{Var. Between Groups}}{\text{Var. Within Groups}} = \frac{\frac{SSG}{df_{groups}}}{\frac{SSE}{df_{error}}}$$

	Group 1	Group 2	$\mu_{A,B,C}$
Block A	8	11	9.5
Block B	10	12	11
Block C	12	13	12.5
$\mu_{1,2}$	10	12	11

$$\begin{aligned} SSG &= 6 \\ SSB &= 9 \\ SST &= 16 \\ SSE &= 1 \\ df_{groups} &= 1 \\ df_{error} &= 2 \end{aligned}$$

## TWO-WAY ANOVA

So how do we calculate F?

$$F = \frac{\frac{SSG}{df_{groups}}}{\frac{SSE}{df_{error}}} = \frac{\frac{6}{1}}{\frac{1}{2}} = 12$$

$$F = \frac{\text{Var. Between Groups}}{\text{Var. Within Groups}} = \frac{\frac{SSG}{df_{groups}}}{\frac{SSE}{df_{error}}}$$

	Group 1	Group 2	$\mu_{A,B,C}$
Block A	8	11	9.5
Block B	10	12	11
Block C	12	13	12.5
$\mu_{1,2}$	10	12	11

$$SSG = 6$$

$$SSB = 9$$

$$SST = 16$$

$$SSE = 1$$

$$df_{groups} = 1$$

$$df_{error} = 2$$

## TWO-WAY ANOVA

$F_{groups} = 12$  feels like a high value.

However, in a two-way ANOVA,

$F_{critical}$  is found for groups and blocks separately!

$$F = \frac{\text{Var. Between Groups}}{\text{Var. Within Groups}} = \frac{\frac{SSG}{df_{groups}}}{\frac{SSE}{df_{error}}}$$

	Group 1	Group 2	$\mu_{A,B,C}$
Block A	8	11	9.5
Block B	10	12	11
Block C	12	13	12.5
$\mu_{1,2}$	10	12	11

$$SSG = 6$$

$$SSB = 9$$

$$SST = 16$$

$$SSE = 1$$

$$df_{groups} = 1$$

$$df_{error} = 2$$

## TWO-WAY ANOVA

$F_{groups} = 12$  feels like a high value.

For groups, with 1 df in the numerator and 2 df in the denominator,

$$F_{critical} = 18.5$$

$$F = \frac{\text{Var. Between Groups}}{\text{Var. Within Groups}} = \frac{\frac{SSG}{df_{groups}}}{\frac{SSE}{df_{error}}}$$

	Group 1	Group 2	$\mu_{A,B,C}$
Block A	8	11	9.5
Block B	10	12	11
Block C	12	13	12.5
$\mu_{1,2}$	10	12	11

$$SSG = 6$$

$$SSB = 9$$

$$SST = 16$$

$$SSE = 1$$

$$df_{groups} = 1$$

$$df_{error} = 2$$

## ANOVA EXERCISE#2

- Let's go back to the invoice problem, and add a new independent variable
- Here each **block** represents an invoice amount
- The dependent variable is still days elapsed until payment

	2% disc	1% disc	no disc
\$50	16	23	21
\$100	14	21	16
\$150	11	16	18
\$200	10	15	14
\$250	9	10	11

## ANOVA EXERCISE#2

1. Calculate the group means, the block means, and the total mean

	2% disc	1% disc	no disc	$\mu_{\text{block}}$
\$50	16	23	21	20
\$100	14	21	16	17
\$150	11	16	18	15
\$200	10	15	14	13
\$250	9	10	11	10
$\mu_{\text{col}}$	12	17	16	<b>15</b>

# ANOVA EXERCISE#2

## 2. Sum of Squares Groups

$$(\mu_2 - \mu_{TOT})^2 = (12 - 15)^2 = 9$$

$$(\mu_1 - \mu_{TOT})^2 = (17 - 15)^2 = 4$$

$$(\mu_0 - \mu_{TOT})^2 = (16 - 15)^2 = 1$$

---

14

Multiply by the number of items in each group:

$$14 \times 5 = 70$$

	2% disc	1% disc	no disc	$\mu_{\text{block}}$
\$50	16	23	21	20
\$100	14	21	16	17
\$150	11	16	18	15
\$200	10	15	14	13
\$250	9	10	11	10
$\mu_{\text{col}}$	12	17	16	<b>15</b>

$$SSG = 70$$

## ANOVA EXERCISE#2

### 3. Degrees of Freedom Groups

$$\begin{aligned}df_{groups} &= n_{groups} - 1 \\&= 3 - 1 \\&= 2\end{aligned}$$

	2% disc	1% disc	no disc	$\mu_{block}$
\$50	16	23	21	20
\$100	14	21	16	17
\$150	11	16	18	15
\$200	10	15	14	13
\$250	9	10	11	10
$\mu_{col}$	12	17	16	<b>15</b>

$$SSG = 70$$

$$df_{groups} = 2$$

## ANOVA EXERCISE#2

### 4 Sum of Squares Block

$$(\mu_{50} - \mu_{TOT})^2 = (20 - 15)^2 = 25$$

$$(\mu_{100} - \mu_{TOT})^2 = (17 - 15)^2 = 4$$

$$(\mu_{200} - \mu_{TOT})^2 = (15 - 15)^2 = 0$$

$$(\mu_{200} - \mu_{TOT})^2 = (13 - 15)^2 = 4$$

$$(\mu_{250} - \mu_{TOT})^2 = (10 - 15)^2 = 25$$

$$58 \times 3 = 174$$

---

58

	2% disc	1% disc	no disc	$\mu_{\text{block}}$
\$50	16	23	21	20
\$100	14	21	16	17

\$250	9	10	11	10
$\mu_{col}$	12	17	16	15

$$SSG = 70$$

$$SSB = 174$$

$$SST = 268$$

$$SSE = 24$$

$$df_{groups} = 2$$

$$df_{error} = 8$$

## ANOVA EXERCISE#2

8. Calculate F

$$F = \frac{\frac{SSG}{df_{groups}}}{\frac{SSE}{df_{error}}} = \frac{\frac{70}{2}}{\frac{24}{8}} = \frac{35}{3} = 11.67$$

	2% disc	1% disc	no disc	$\mu_{block}$
\$50	16	23	21	20
\$100	14	21	16	17
\$150	11	16	18	15
\$200	10	15	14	13
\$250	9	10	11	10
$\mu_{col}$	12	17	16	15

$$SSG = 70$$

$$SSB = 174$$

$$SST = 268$$

$$SSE = 24$$

$$df_{groups} = 2$$

$$df_{error} = 8$$

$$F = 11.67$$

## ANOVA EXERCISE#2

9. Find  $F_{\text{critical}}$

$$\alpha = 0.05$$

$$df_{\text{numerator}} = 2$$

$$df_{\text{denominator}} = 8$$

$$F_{\text{critical}} = 4.46$$

	2% disc	1% disc	no disc	$\mu_{\text{block}}$
\$50	16	23	21	20
\$100	14	21	16	17
\$150	11	16	18	15
\$200	10	15	14	13
\$250	9	10	11	10
$\mu_{\text{col}}$	12	17	16	15

$$SSG = 70$$

$$SSB = 174$$

$$SST = 268$$

$$SSE = 24$$

$$df_{\text{groups}} = 2$$

$$df_{\text{error}} = 8$$

$$F = 11.67$$

$$F_{\text{critical}} = 4.46$$

## ANOVA EXERCISE #2

Since  $F$  falls to the right of  $F_{\text{critical}}$

$$4.46 < 11.67$$

we reject the null hypothesis!

Offers don't result in faster payments

$$SSG = 70$$

$$SSB = 174$$

$$SST = 268$$

$$SSE = 24$$

$$df_{\text{groups}} = 2$$

$$df_{\text{error}} = 8$$

$$F = 11.67$$

$$F_{\text{critical}} = 4.46$$

# **TWO-WAY ANOVA WITH REPLICATION**

# WITHOUT VS WITH REPLICATION

without replication

	GroupA	GroupB	GroupC
Block1	16	23	21
Block2	14	21	16
Block3	11	16	18
Block4	10	15	14
Block5	9	10	11
Block6	8	8	10

with replication

	GroupA	GroupB	GroupC
Block1	16	23	21
	14	21	16
	11	16	18
Block2	10	15	14
	9	10	11
	8	8	10

Samples have multiple values  
Samples have a mean value

# TWO-WAY ANOVA WITH REPLICATION

- Introduces the concept of **sample means** and **sample variance**
- Introduces the concept of **interactions**

## TWO-WAY ANOVA WITH REPLICATION

- As with our previous 2-way ANOVA, we consider two independent variables organized into groups and blocks
- We sample every block/group combination
- With replication, block/group samples have multiple measurements

## TWO-WAY ANOVA WITH REPLICATION

- Consider an experiment that measures the height of plants
- We apply three types of fertilizer A, B & C – these are our Groups
- Plants are kept at two temperatures (warm & cold) – these are our Blocks
- We assign 3 plants to each sample

## TWO-WAY ANOVA

- First calculate the mean for each 3-item sample
- Calculate column means
- Calculate block means
- Calculate the overall mean

Fertilizer:	A	B	C		
Warm	13	21	18	16	Block Means
	14	19	15		
	12	17	15		
Cold	16	14	15	14	Block Means
	18	11	13		
	17	14	8		
Sample Means		13	19	16	
		17	13	12	
Column Means		15	16	14	15

## TWO-WAY ANOVA

- As before, calculate the Sum of Squares Blocks

$$(16 - 15)^2 + (14 - 15)^2 = 2$$

× 9 items per block = **18**

Fertilizer:	A	B	C		
Warm	13	21	18	<b>16</b>	Block Means
	14	19	15		
	12	17	15		
Cold	16	14	15	<b>14</b>	Block Means
	18	11	13		
	17	14	8		
Sample Means	13	19	16		
	17	13	12		
Column Means	<b>15</b>	<b>16</b>	<b>14</b>	<b>15</b>	

SSB = 18

## TWO-WAY ANOVA

- As before, calculate the Sum of Squares Columns

$$(15 - 15)^2 + (16 - 15)^2 + (14 - 15)^2 = 2$$

$$\times 6 \text{ items per column} = 12$$

Fertilizer:	A	B	C		
Warm	13	21	18	16	Block Means
	14	19	15		
	12	17	15		
Cold	16	14	15	14	Block Means
	18	11	13		
	17	14	8		
Sample Means	13	19	16		
	17	13	12		
Column Means	15	16	14		
				15	

SSB = 18    SSC = 12

## TWO-WAY ANOVA

- As before, calculate the Degrees of Freedom Columns

$$df_{columns} = (3 - 1) = 2$$

Fertilizer:	A	B	C		
Warm	13	21	18	16	Block Means
	14	19	15		
	12	17	15		
Cold	16	14	15	14	Block Means
	18	11	13		
	17	14	8		
Sample Means	13	19	16		
	17	13	12		
Column Means	15	16	14	15	

SSB = 18    SSC = 12     $df_{columns} = 2$

## TWO-WAY ANOVA

- We have a new statistic: SS Interactions
- For each sample mean, subtract the matching block and column means, square the result

Fertilizer:	A	B	C		
Warm	13	21	18	<b>16</b>	Block Means
	14	19	15		
	12	17	15		
Cold	16	14	15	<b>14</b>	Block Means
	18	11	13		
	17	14	8		

Sample Means	13	19	16
	17	13	12
Column Means	<b>15</b>	<b>16</b>	<b>14</b>
			<b>15</b>

SSB = 18    SSC = 12     $df_{\text{columns}} = 2$

## TWO-WAY ANOVA

$$\begin{aligned}
 & (13 - 16 - 15 + 15)^2 + \\
 & (19 - 16 - 16 + 15)^2 + \\
 & (16 - 16 - 14 + 15)^2 + \\
 & (17 - 14 - 15 + 15)^2 + \\
 & (13 - 14 - 16 + 15)^2 + \\
 & (12 - 14 - 14 + 15)^2 = 28 \\
 & \times 3 \text{ items per sample} = 84
 \end{aligned}$$

Fertilizer:	A	B	C	Block Means
Warm	13 14 12	21 19 17	18 15 15	
Cold	16 18 17	14 11 14	15 13 8	14

Sample Means	13 17	19 13	16 12
Column Means	15	16	14

15

$$\begin{aligned}
 \text{SSB} &= 18 & \text{SSC} &= 12 & \text{df}_{\text{columns}} &= 2 \\
 \text{SSI} &= 84
 \end{aligned}$$

## TWO-WAY ANOVA

- Calculate the Sum of Squares Total

4	36	9	
1	16	0	
9	4	0	
1	1	0	
9	16	4	
4	1	49	<b>164</b>

Fertilizer:	A	B	C	
Warm	13	21	18	<b>16</b>
	14	19	15	
	12	17	15	
Cold	16	14	15	<b>14</b>
	18	11	13	
	17	14	8	

Block Means

Sample Means	13	19	16
	17	13	12
Column Means	<b>15</b>	<b>16</b>	<b>14</b>
			<b>15</b>

$$SSB = 18 \quad SSC = 12 \quad df_{\text{columns}} = 2$$

$$SSI = 84$$

$$SST = 164$$

## TWO-WAY ANOVA

- Calculate the Sum of Squares Error by subtracting the other values from the SST:  
 $164 - 18 - 12 - 84 = 50$

Fertilizer:	A	B	C		
Warm	13	21	18	16	Block Means
	14	19	15		
	12	17	15		
Cold	16	14	15	14	Block Means
	18	11	13		
	17	14	8		
Sample Means	13	19	16		
	17	13	12		
Column Means	15	16	14	15	

$$\begin{aligned}
 \text{SSB} &= 18 & \text{SSC} &= 12 & \text{df}_{\text{columns}} &= 2 \\
 \text{SSI} &= 84 & \text{SSE} &= 50 & & \\
 \text{SST} &= 164 & & & & 
 \end{aligned}$$

# TWO-WAY ANOVA

- Degrees of Freedom Error

$$\text{blocks} \times \text{columns} \times (\text{items} - 1)$$

$$= 2 \times 3 \times (3 - 1) = \mathbf{12}$$

Fertilizer:	A	B	C		
Warm	13	21	18	<b>16</b>	Block Means
	14	19	15		
	12	17	15		
Cold	16	14	15	<b>14</b>	Block Means
	18	11	13		
	17	14	8		

Sample Means	13	19	16
	17	13	12
Column Means	<b>15</b>	<b>16</b>	<b>14</b>
			<b>15</b>

$$\begin{aligned} \text{SSB} &= 18 & \text{SSC} &= 12 & \text{df}_{\text{columns}} &= 2 \\ \text{SSI} &= 84 & \text{SSE} &= 50 & \text{df}_{\text{error}} &= 12 \\ \text{SST} &= 164 \end{aligned}$$

## TWO-WAY ANOVA

- Calculate F

$$F = \frac{\frac{SSC}{df_{columns}}}{\frac{SSE}{df_{error}}} = \frac{\frac{12}{2}}{\frac{50}{12}} = 1.44$$

Fertilizer:	A	B	C		
Warm	13	21	18	<b>16</b>	Block Means
	14	19	15		
	12	17	15		
Cold	16	14	15	<b>14</b>	Block Means
	18	11	13		
	17	14	8		
Sample Means	13	19	16		
	17	13	12		
Column Means	<b>15</b>	<b>16</b>	<b>14</b>	<b>15</b>	

SSB = 18    SSC = 12     $df_{columns} = 2$   
 SSI = 84    SSE = 50     $df_{error} = 12$   
 SST = 164

# TWO-WAY ANOVA

$$F = 1.44$$

Look up  $F_{\text{critical}}$

$$F_{(0.05, 2, 12)} = 3.885$$

Fertilizer:	A	B	C	Block Means
Warm	13	21	18	
	14	19	15	
	12	17	15	
Cold	16	14	15	
	18	11	13	
	17	14	8	

Sample Means	13	19	16
	17	13	12
Column Means	15	16	14

15

SSB = 18    SSC = 12     $df_{\text{columns}} = 2$   
 SSI = 84    SSE = 50     $df_{\text{error}} = 12$   
 SST = 164

# TWO-WAY ANOVA

- A look at Interaction:

Fertilizer:	A	B	C	Block Means
Warm	13	21	18	
	14	19	15	
	12	17	15	
Cold	16	14	15	14
	18	11	13	
	17	14	8	

Sample Means	13	19	16
	17	13	12
Column Means	15	16	14
	15		

$$\begin{aligned}
 \text{SSB} &= 18 & \text{SSC} &= 12 & \text{df}_{\text{columns}} &= 2 \\
 \text{SSI} &= 84 & \text{SSE} &= 50 & \text{df}_{\text{error}} &= 12 \\
 \text{SST} &= 164 & & & &
 \end{aligned}$$
